ECS 251 Operating System: Meeting #4

Professor Sam King

Fatemeh Radaei, Yuchu Lei, Weijia Xing

We are working on word filter function implementation on Mastodon. On the basis of result last week, we give the function of sentiment/negative test, which can break the given sentence into several pieces, then we score each pieces to give a final score of the sentence. Current result for short sentences works pretty well.

We also create a shield filter that shield the sensitive content based on sentiment analysis. To do this, we have changed database, will apply sentiment analysis module to timeline feed and maybe comment section in the future.

We are going to keep enhancing the sentiment analysis function to get a more convincing result in the next following week, and we are interesting in another function that relate with sentiment analysis which is about fake news analysis function, but there are many uncertain things for now.
